### 1. Use information

Dear distinguished customer,

Thanks for choosing VALUE vacuum pump of high reliability (Hereinafter referred to as "the pump").

Please check carefully whether the product received is the same as you ordered and the accessories, spare parts & operating manual are attached as well. Please also check if there's any damage occurred during transportation. If needed, contact the local distributor or our sales team.

In order to maintain a stable performance level of the pump, read this operating manual carefully to fully understand the safety instructions, technical data as well as operating procedures before installation, operation, repair and maintenance of the pump.

#### Warning

Failure to observe the terms could result in serious personal injury.

#### **Notice**

Failure to observe the terms could result in damage to the pump.

This warning label indicates risk of electrical shock. Disconnect the pump from the power supply before beginning with connections, repair and maintenance. Make sure the cover of junction box is properly installed before running.

This warning label indicates high temperature hazard. Do not touch the pump when the pump is in operation.

#### **Notice**

Read the operating manual carefully and follow the operating procedures. We reserve the right to modify the design and technical data of the pump without notice which may have discrepancies in the manual. Add vacuum oil as requested before starting the new pump.

#### 2. Attention

In order to ensure the personal safety, read the operating manual carefully before installation, operation, repair and maintenance.

#### Warning

According to the technical guidelines and wiring regulations for electrical equipment, the power supply must match with the information shown on the pump nameplate and the electrical connections must be performed by a skilled electrician.

#### Warning

To prevent electrical hazards and sudden start-up hazard which may result in personal injury, disconnect the power supply before checking or repairing the pump.

#### Warning

Before starting the pump, the motor must be effectively grounded and properly connected with a rated motor protection switch.

#### Warning

The pump is strictly prohibited to pump dusty, active toxic, corrosive, flammable and explosive gases.

## Warning

Do not place obstacles which may affect the ventilation of the motor to avoid burn hazard and fire caused by abnormal temperature rise.

#### Warning

The exhaust passage must be unimpeded during operation. Make sure that the gas flow from the exhaust port is not blocked or restricted in any way.

#### **Notice**

The pump must be operated at ambient temperature between 10 - 40 °C.

#### **Notice**

Check the oil level before running. Do not operate the pump without oil or short of oil. Otherwise it will result in pump failure.

#### **Notice**

Check oil leakage of the pump to prevent slip hazard caused by spilled oil.

#### **Notice**

Running without oil lubrication or wrong rotation direction of the motor may cause pump failure.

#### **Notice**

Do not connect the intake port with an overpressure device. Make sure the size of the exhaust passage with absolute pressure is not more than 1.35 bar (relative pressure is not more than 0.35 bar).

#### **Notice**

Disposal of used oil and other parts must be in compliance with local relevant environmental laws and regulations

#### **Notice**

To pump condensable gases, only use the pump installed with gas ballast.

#### **Notice**

While pumping a small amount of dust and condensable gases, an installation of corresponding filters is required. Otherwise it will cause pump failure or sharp drop of performance.

## 3. Description

VDC series vacuum pump is an innovative motor direct drive dual-stage oil sealed rotary vane pump with DC motor. The pump features small motor power design for energy-saving, DC output with low noise level and optional corrosion resistance. Therefore, the pump is an ideal choice for high requirements of quiet operation, especially for analytical applications.

Fig. 2 Functional diagram

## 3.1 Principle of Operation

Refer to Fig. 2, the rotor mounted eccentrically in the pump cylinder, has two vanes which divide the pump chamber into three changeable compartments. When the rotor rotates clockwise, gas is sucked into chamber 1 gradually, transferred by chamber 2, and compressed and exhausted by chamber 3. The working cycle is repeated to achieve the vacuum of the system. The exhausted gas from the first stage goes into the second stage (low-vacuum stage) through air channel, and is compressed again before discharging into atmosphere to achieve a lower ultimate vacuum pressure.

#### 3.2 Principle of Gas Ballast

The controllable gas (generally dry air at room temperature) is admitted into the pump chamber. It is mixed with pumped vapor during the gas compression process.

This increases the percentage of non-condensable gas such that the partial pressure of the vapor being pumped is below its saturated vapor pressure when the exhaust valve opens. The vapor is then discharged from the pump without liquefaction. The more vapor contained in the pumped gas, the more dry air is required (See Fig. 7 Gas ballast valve).

## 4. Technical Parameters

Model		VDC-4	VDC-6	VDC-8	VDC-12	
Displacement speed m³/h (L/s)	50 <b>/60</b> Hz	4 (1.1)	6 (1.6)	8 (2.2)	11 (3.0)	
Ultimate partial pressure gas ballast close (Pa)	Iltimate partial pressure gas ballast close (Pa)				5×10 <sup>-2</sup>	
Ultimate total pressure gas ballast close (Pa)	Jltimate total pressure gas ballast close (Pa)				5×10 <sup>-1</sup>	
Ultimate total pressure gas ballast open (Pa)		10	10	10	10	
Power supply		Single Phase 220 V/50 - 60 Hz				
Power rating (kW)	0.37	0.37	0.37	0.37		
Intake and exhaust DN (mm)		KF16/25	KF16/25	KF16/25	KF16/25	
Oil capacity (L)		0.6~1.0	0.6~1.0	0.6~1.0	0.6~1.0	
Ambient temperature (°C)		10 - 40				
Noise level (dB)		≤50	≤50	≤52	≤52	
Net weight (kg)	14.5	14.5	15.5	15.5		

Table 1

## **Pumping speed characteristics**

Fig. 3

## 5. Transport and Storage

## Warning

Do not move the pump unless it's switched off and the power supply is disconnected.

#### **Notice**

Check carefully if there's any packaging damage during transportation.

#### Notice

Move the pump with care. Any negligence will cause pump damage during transportation. In order to avoid oil spilling, move the pump fully filled with oil in horizontal direction.

### **Notice**

Disposal of used packing material shall be in compliance with local environmental laws and regulations.

#### **Notice**

For long term storage, clean the pump and empty the oil inside. Store the pump in a dry place at room temperature.

## 6. Installation and Connection

#### **6.1 Installation Dimensions**

Fig. 4

Table 2

#### 6.2 Connection to System

#### Warning

The pump is strictly forbidden to operate in areas with risk of fire and explosion.

#### Warning

Make sure the gas flow at the exhaust port is not blocked or restricted in any way. Check to ensure the exhaust line is not obstructed by deposits before start-up.

#### Warning

The exhaust pressure shall not be 1.15 bar higher than the absolute pressure (relative pressure 0.15 bar) but not be lower than atmospheric pressure.

#### Notice

Take the following into account to choose the pump installation site: convenient for installation, maintenance, disassembly and electrical connections as well as good ventilation.

#### **Notice**

Place the pump feet horizontally or fix the feet with bolts while connecting the pump to vacuum system.

#### **Notice**

Oblique installation may result in pump's vibration, high noise or even damage. The pump shall be set up on a flat and firm surface.

#### Notice

The length of connecting line between pump and vacuum system shall be as short as possible. The diameter of the connecting line shall be the same as that of intake port.

#### **Notice**

The hoop at intake port is available for connection with vacuum hose or regular vacuum pipe. No any stress generated by the pipe on the hoop is allowed while connecting.

#### **Notice**

The exhaust line should be laid so that it slopes down so as to prevent condensate from backstreaming into the pump and contaminating the oil. Drain the oil in the exhaust line periodically to avoid block of exhaust line. If the exhaust line slopes up, the installation of a condensate trap is necessary. Check leak of the connection between pipe and flange. Vacuum tightness is essential for the achievement of ultimate pressure of the pump.

#### 6.3 Power Supply

#### Warning

Make sure the power supply is correct. The electrical connections must be performed by a skilled electrician according to the technical guidelines and wiring regulations for electrical equipment. The extra selected cable and motor protection switch shall have the same rated current value as stated on the motor nameplate.

## 7. Initial Start and Operation

#### 7.1 Start-up

#### Warning

Make sure the gas flow at the exhaust port is not blocked or restricted in any way. Do not start the pump if the exhaust port is blocked.

#### Warning

The oil level shall be kept between position MAX and MIN of oil sight glass. Excessive or insufficient oil will decrease the pump performance or even cause malfunction. The pump must be stopped before adding oil.

#### Warning

Make sure the gas flow at the exhaust port is not blocked or restricted in anyway. Do not start the pump if the exhaust port is blocked.

#### Notice

The operating ambient temperature is 10 - 40 °C and humidity should be less than 85%.

#### 7.2 Operation

#### **Notice**

High temperature hazard! Do not touch the surface! The surface of the pump could be very hot during operation and after shutdown within one hour.

#### Pumping non-condensable gases

Close the gas ballast to pump non-condensable gases (Set the gas ballast to position C, refer to Fig. 6). The ultimate pressure will rise (loss of vacuum) with gas ballast opened.

Fig. 6 Gas Ballast Valve

#### Pumping condensable gases and vapor

If the vacuum system contains a small amount of condensable gas, open the gas ballast valve (Set the gas ballast to position I or II, refer to Fig. 6) and keep the pump running for at least 30 minutes to pump the condensable gas effectively. Close the gas ballast valve when the vacuum system pressure is reduced to a certain value. If the pump operates at low temperature, condensable gas may be dissolved in the pump oil. The oil may be emulsified or deteriorated which will affect the pump performance, even cause corrosion of the pump body.

The rise of oil level during pump operation is a sign of condensable gas contained in the vacuum system.

Do not switch off the pump immediately when the process is finished. Keep the pump running with gas ballast open and intake port closed until all gases dissolved in the oil are removed.

## 8. Inspection and Maintenance

#### Warning

All checks and maintenance must be performed by trained personnel in accordance with local safety rules and regulations.

#### Warning

In case of presence of hazardous substances due to oil decomposition or media sucked into the pump, it's necessary to define the hazard and take all necessary safety precautions.

#### Warning

In the presence of hazardous substances, determine the hazard in the first time and follow all appropriate safety procedures. If the potential hazard still exists, the pump must be decontaminated before any maintenance.

## 8.1 Routine inspection

Content	Operation	Interval	Remarks
Oil level	Visual inspection	Every three days	8.2.1
Oil color	Visual inspection	Every three days	8.2.1
Pump noise	Acoustic inspection	Every three days	8.2.2
Pump vibration	vibration Visual inspection Every three days		Check the pump feet or feet bolts in case of abnormal vibration.
Pump temperature	Temperature meter	Every one week	Check and clean fan of the pump and motor for deposits.
Seal & O-ring	Visual inspection	Every one month	Replace it if necessary
Dirt trap	Dirt trap Visual inspection		Check and clean the foreign matter. Dry it by compressed air.

Table 3

#### 8.2 Maintenance

#### 8.2.1 Checking oil level

- 1) The oil level shall be always kept between position MAX and MIN of oil sight glass during operation (refer to Fig. 6). Add oil when the oil level is lower than position MIN and discharge oil by removing the oil drain plug (refer to Fig. 1) when the oil level is above position MAX.
- 2) Check the oil color. Replace the oil if the color is other than clear and transparent.

#### 8.2.2 Checking pump's noise

The pump noise shall be continuous and stable during operation. If any abnormal noise is found, refer to Table 4 Troubleshooting.

#### 8.2.3 Changing oil

- 1) Change the oil when the pump is switched off and cooled down.
- 2) Remove the oil drain plug (Fig. 1) and drain the used oil into a suitable receptacle. When the flow of oil stops, screw on the oil drain plug and start the pump shortly (10 seconds). Switch off the pump, remove the plug again and drain the residual oil. Screw on the oil drain plug (Check O-ring, replace it if necessary). Remove the oil fill plug (Fig. 1) and fill in fresh pump oil which is specified or provided by the manufacturer.
- 3) After oil changing, handle the used oil stored in an assigned container according to local relevant environmental laws and regulations.

#### 8.2.4 Regularly checking intake filter and anti-suckback valve

Regularly take down the intake port and clean the filter by compressed air. Check the seal position of anti-suckback valve for cleanness, damage, hardening and height.

#### 8.2.5 Regularly checking fan cover and motor fan

Regularly remove the clean the fan cover and motor fan. Clean them by compressed air and reinstall them properly before pump operation.

## 9. Troubleshooting

vacuum vessel.	3. Anti-suckback valve plate is obstructed.	3. Replace anti-suckback valve plate.
Vacuum pressure	4. Oil level is high.	4. Drain the excess oil.
in system <b>rises</b>	Vacuum system leak.	1. Check the system.
too fast when pump stops.	Anti-suckback valve is malfunctioning.	2. Repair anti-suckback valve.
Too much oil	1. Too much oil in the pump.	1. Drain some oil.
in the exhaust port.	Continuous operation under high pressure in the intake port.	2. Shorten exhaust time.
Port.	Oil mist filter is obstructed.	3. Replace oil mist filter.
Sealing	1. The seal is damaged.	1. Replace the seal.
surface leak	2. Seal ring is damaged.	2. Replace the seal ring.

Table 4

## 10. Warranty

VDC series vacuum pumps have one year guarantee from the date of purchase. Spare parts will be provided free of charge within the period of guarantee in condition that the pump is operated according to the operating manual. The following failures will be charged for repair:

- 1) Malfunction caused by nature disasters or artificial factors
- 2) Malfunction caused by special operating environment
- 3) Damage of wear parts
- 4) Malfunction caused by abnormal operation or incorrect use indentified by our engineers

Before the pump is delivered to our company for maintenance, it is required to acquire the information if the pump is contaminated (and which kind of pollutants) or hazardous substances exist inside the pump. Without receiving this statement in advance, the pump will be returned to the address of the sender.

#### 11. Accessories

To ensure the stability of the pump, it is recommended to use genuine spare parts and accessories provided by the manufacturer. If you need further assistance, please contact us.

The accessories below are for your selection:

- 1) Wear parts. Check the exploded view and spare parts list to select the required spare parts with corresponding item numbers.
- 2) Intake port/exhaust port other than default one
- 3) Dust filter

## **Correct Disposal of this product:**

This marking indicates that this product should not be disposed with other household wastes. To prevent possible harm to the environment or human health from uncontrolled waste disposal, please use the return and collection systems or contact the retailer where the product was purchased. They can take this product for environmental safe recycling.
